

AQR International Defensive Style Fund

A Lower Risk Equity Solution

The AQR International Defensive Style Fund pursues a defensive strategy that seeks to provide exposure to international markets with lower risk through active stock selection, risk management and diversification.

Seeks Market-Like Returns with Lower Risk

The Fund seeks to deliver returns similar to its benchmark but with lower volatility. It seeks to invest in stocks that are more stable and exhibit lower risk characteristics.

Seeks to Outperform During Down Markets

The Fund provides potential for favorable long-term returns with an attractive risk profile during market downturns. In this market condition, Defensive Equity has the potential to fare better than the broader market.

Exposure to High Quality Companies

The Fund utilizes a systematic, disciplined approach to target stocks that have demonstrated measures of quality such as smaller stock price fluctuations, higher profit margins, and low operating and financial leverage.

Defensive Equity seeks to participate in much of the upside of equity market returns and less of the downside

PRINCIPAL RISKS:

This Fund is not suitable for all investors. An investor considering the Fund should be able to tolerate potentially wide price fluctuations. The Fund may attempt to increase its income or total return through the use of securities lending, and they may be subject to the possibility of additional loss as a result of this investment technique.

An investment in the Fund is subject to risks, including the possibility that the value of the Fund’s portfolio holdings may fluctuate in response to events specific to the companies in which the Fund invests, as well as economic, political or social events in the United States or abroad.

Diversification does not eliminate the risk of experiencing investment losses.

Derivatives may be more sensitive to changes in economic or market conditions than other types of investments; this could result in losses that significantly exceed the fund’s original investment. The Fund seeks total return. Total return consists of capital appreciation and income.

Annualized risk is calculated as the annualized standard deviation of the past 12 month daily returns of a given security or index in excess of cash. Standard deviation of return measures the average deviations of a return series from its mean, and is often used as a measure of risk.

Beta is a security’s (or strategy’s) sensitivity to a particular risk factor. For example, an equity index fund’s beta to the equity market will likely be 1.0. A twice-levered equity index fund’s beta to the equity market will likely be about 2.0.

The MSCI World ex USA Index captures large and mid cap representation across 22 of 23 Developed Markets (DM) countries* excluding the United States. With 1,020 constituents, the index covers approximately 85% of the free float-adjusted market capitalization in each country.

An investor should consider the investment objectives, risks, charges and expenses of the Fund carefully before investing.
