

AQR Large Cap Defensive Style Fund

Market-like Returns with Lower Risk

The AQR Large Cap Defensive Style Fund pursues a defensive strategy that seeks to provide exposure to the U.S. market with lower risk through active stock selection, risk management and diversification.

Risk-adjusted Return Potential

The Fund invests in high quality, low beta stocks that tend to be less volatile than the market average. These stocks aim to provide market-like returns with lower risk than market indices over a full market cycle.

Disciplined Investment Process

Using a systematic, rules-based approach, the Fund invests in lower risk stocks from both a statistical and fundamental perspective, targeting companies with stable business models, high profitability, low operating and financial leverage.

Broadly Diversified Portfolio

Investing in equities across the full spectrum of the U.S. large cap universe, the Fund seeks to benefit from holding numerous small and moderate-sized active positions, rather than fewer, more concentrated ones.

Defensive Strategies offer potential for upside returns while seeking to manage against the downside

PRINCIPAL RISKS:

This Fund is not suitable for all investors. An investor considering the Funds should be able to tolerate potentially wide price fluctuations. The Funds may attempt to increase its income or total return through the use of securities lending, and they may be subject to the possibility of additional loss as a result of this investment technique.

An investment in the Fund is subject to risks, including the possibility that the value of the Fund’s portfolio holdings may fluctuate in response to events specific to the companies in which the Fund invests, as well as economic, political or social events in the United States or abroad.

Diversification does not eliminate the risk of experiencing investment losses.

Derivatives may be more sensitive to changes in economic or market conditions than other types of investments; this could result in losses that significantly exceed the fund’s original investment.

Annualized risk is calculated as the annualized standard deviation of the past 12 month daily returns of a given security or index in excess of cash. Standard deviation of return measures the average deviations of a return series from its mean, and is often used as a measure of risk.

Beta is a security (or strategy’s) sensitivity to a particular risk factor. For example, an equity index fund’s beta to the equity market will likely be 1.0. A twice-levered equity index fund’s beta to the equity market will likely be about 2.0.

The Russell 1000 Index measures the performance of the large-cap segment of the U.S. equity universe. It is a subset of the Russell 3000 Index and includes approximately 1,000 of the largest securities based on a combination of their market cap and current index membership. The Russell 1000 represents approximately 90% of the U.S. market.
